

IN THE CLAIMS:

Please amend claims 1, 5, 12, and 16 as follows.

1. (Currently Amended) A mobile communication system comprising at least one mobile communication network; at least one service center for point-to-multipoint services; and one or more network nodes through which a point-to-multipoint service is transmitted to cells within the service area of the network node ,
wherein

the system comprises defining means for defining geographical destination areas of the point-to-multipoint service, each geographical destination area of the point-to-multipoint service being indicated in the system as a predetermined logical name included in a service request of the point-to-multipoint service, wherein a destination area ~~may comprise~~includes cells within the service area of at least two different network nodes, and

memory means for mapping each logical name corresponding to a geographical destination area of the point-to-multipoint service to one or more network element addresses of the system, and

the at least one service center is arranged to inquire, in response to a received service request, from the memory means the addresses of the network elements corresponding to the logical name in the received service request, and to transmit the point-to-multipoint service via the network elements to cells belonging to the geographical destination area of the point-to-multipoint service.

2. (Previously Presented) The mobile communication system according to claim 1,
wherein

the service center is also arranged to check whether the network element address
is the address of a second service center and, if yes, to transmit the service request to the
second service center.

3. (Previously Presented) The mobile communication system according to claim 2,
wherein

the memory means are arranged to link to the address of the second service center
associated with the logical name a second logical name corresponding to the logical name
in the service area of the second service center, and

the service center is arranged to replace the logical name given in the service
request with said second logical name before the service request is transmitted to the
second service center.

4. (Previously Presented) The mobile communication system according to claim
1, wherein

the logical name of the destination area can be determined by means of at least
two logical names and their intermediate logical operator, the logical operator indicating
how the areas of the logical names relate to each other, and

the memory means are arranged to map the logical name of the destination area that is formed by the two or more logical names and the intermediate logical operator between successive names to one or more network element addresses of the system.

5. (Currently Amended) A method for transmitting a point-to-multipoint service of a mobile communication system to a geographical destination area of the point-to-multipoint service , the mobile communication system comprising at least one mobile communication network, at least one service center for point-to-multipoint services, and at least one network node through which the point-to-multipoint service is transmitted to cells within its service area,

the method comprising the steps of:

defining logical names for geographical destination areas of the point-to-multipoint service, where a destination area ~~may comprise~~ includes cells within the service area of at least two different network nodes;

maintaining an address list for each logical name in the mobile communication system, the address list being used for mapping the defined logical names to one or more network element addresses of the system;

receiving a service request at a first service center, the service request including a logical name;

mapping the logical name by means of the address list to one or more network element addresses belonging to the geographical destination area of the point-to-multipoint service, and
transmitting the service via the network elements to cells within their service area.

6. (Previously Presented) The method according to claim 5, the method comprising the steps of:
 checking the address of each network element;
 if the address is an address of a second service center, forwarding the service request to it; and
 if the address is a network node address, transmitting the service via the node to those cells in the service area of the node that belong to the destination area of the service.

7. (Previously Presented) The method according to claim 5, the method comprising the steps of:
 determining at least one logical operator for indicating the destination area by using at least two different logical names and their intermediate logical operator;
 mapping each logical name to one or more network element addresses; and
 combining the network element addresses as determined by the logical operator.

8-11. (Cancelled)

12. (Currently Amended) An area register which forms part of a mobile communication system comprising at least one network, the network comprising a service center for point-to-multipoint services for transmitting a point-to-multipoint service to a geographical destination area indicated in a service request, the destination area being indicated as a logical name included in the service request, wherein the area register comprises:

a list of logical names corresponding to geographical destination areas of the point-to-multipoint service for at least one service center, where a destination area may ~~comprise~~ includes cells within the service area of at least two different network nodes, and at least one network element address list of the system corresponding to each logical name, in order to allow a logical name to be mapped to at least one system network element address within the geographical destination area of the point-to-multipoint service; and

processing means for receiving inquiries concerning the logical names and for replying to the inquiries.

13. (Previously Presented) The area register according to claim 12, wherein the processing means are arranged to
identify logical operators and

map the logical name of a destination area formed by two or more logical names and an intermediate logical operator between successive names to one or more network element addresses of the system.

14. (Previously Presented) The area register according to claim 12, wherein at least one logical name is divided into logical names of a lower hierarchical level so that the geographical destination area of the logical name of the higher hierarchical level is formed of the geographical destination areas of the logical names of the lower hierarchical level.

15. (Previously Presented) The area register according to claim 12, comprising updating means for adding logical names to and for removing them from the list of logical names and for adding network element addresses to and for removing them from the network element address list.

16. (Currently Amended) A service center for transmitting point-to-multipoint services in a mobile communication system to a geographical destination area of the service, the service center comprising
reception means for receiving a service request, the service request including a logical name indicating a destination area of the point-to-multipoint service ,
that ~~may comprise~~ includes cells within the service area of at least two different

network nodes,
inquiry means for mapping the logical name given in the service request to at least one network element address of the system, and
transmission means for transmitting the service to cells belonging to the geographical destination area of the point-to-multipoint service via each network element.

17. (Previously Presented) The service center according to claim 16, comprising:
control means for checking whether a network element is a second service center;
and
if yes, the transmission means are arranged to forward the service request to the second service center.

18. (Previously Presented) The service center according to claim 16, comprising:
load means for monitoring the load of the service center itself and that of the second service center; and
determining means responsive to the load means for re-determining the service area of the second service center.
